General description

PhotoFun Software allows making funny photos merging the predefined templates with phone camera. Some templates are shipped with the application, more templates can be downloaded from the vendors site or made from your own photos.

To create your own template you will have to choose the picture to make the template and edit the picture in some graphical application. We have made instructions for you using Windows built-in MS Paint application or commercial Adobe PhotoShop

We have launched the image in the graphical redactor and resized it to 320*240 pixels (size of the mobile screen, 320 is horizontal value, 240 is vertical value).

If you use the **MS Paint** you will have to fill the region, which should be transparent, and the one upper left pixel with some contrast colour that is not present on the current picture. In our case we have filled the face with yellow colour. Everything that is yellow on the picture, will be transparent.

If you use **PhotoShop** software you have to create the transparent layer above the image and only after that you will have to fill the space, which should be transparent, and the one upper left pixel with the same contrast colour.

Attention! You should fill the upper left pixel and the transparent territory on the picture with **EXACTLY** the same colour, so please check the colour by its hexadecimal value if possible, e.g. “#000000” for “black”.

After that you can save your image as PNG file to your PC using Save As or Save for Web function.

You should transfer the ready template to the mobile phone to the folder **PhotoFun - Templates** with the help of Bluetooth or Datacable.

After receiving the file to your mobile phone with the help of Bluetooth, you will have to save the picture to your mobile phone gallery and move the file to Phone Memory ->

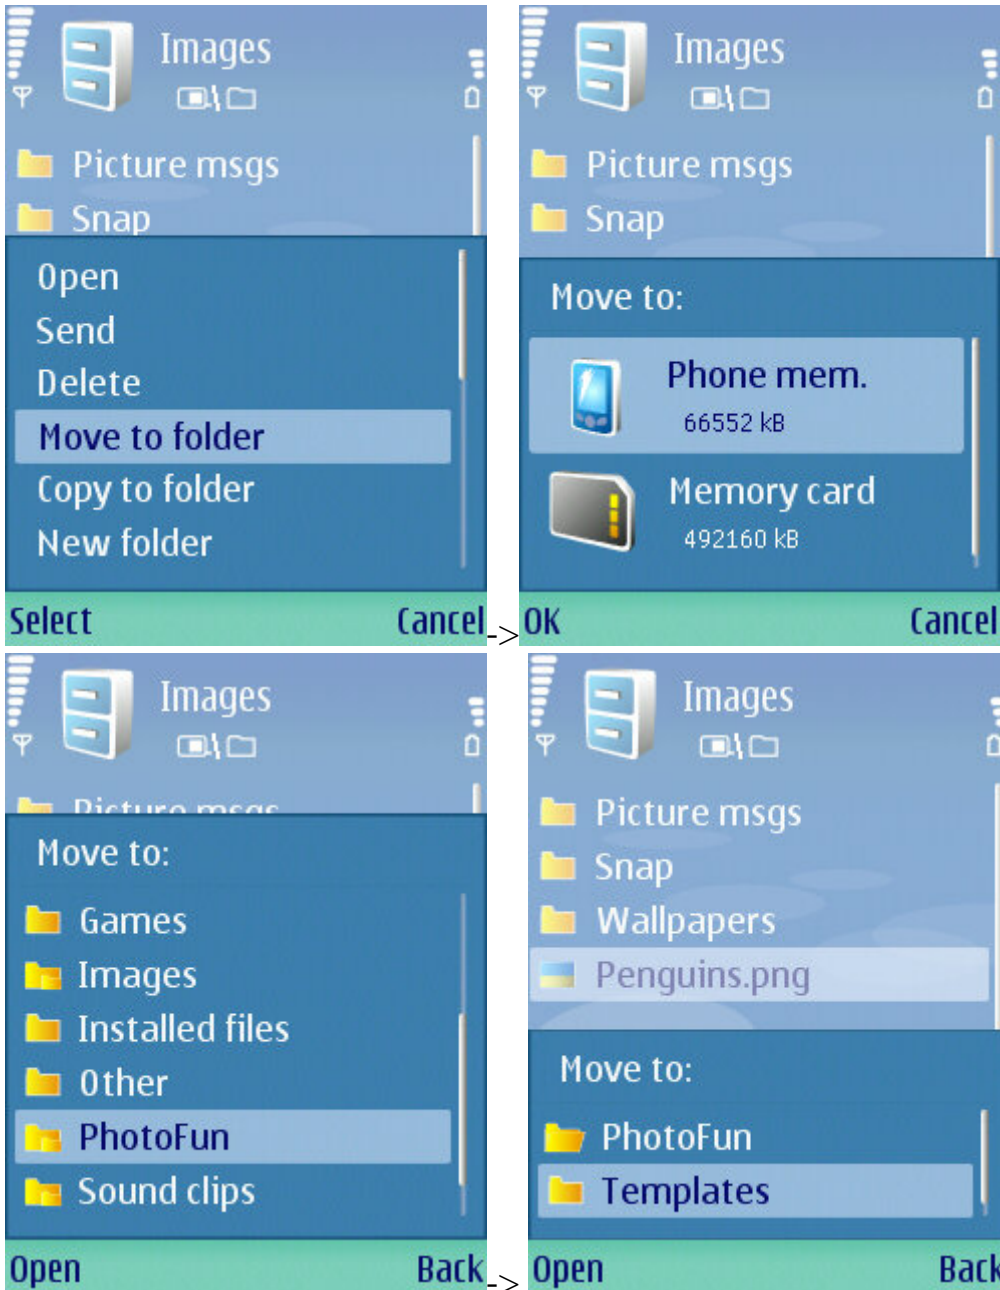

SymbianGuru.com Your guru in mobile software.

->

If you transfer the file with the help of Datacable you can save this file directly to the PhotoFun-Templates folder.

Please restart the application.

Now you are able to use your own template. You should just launch the application and change the current template to the newly created one, you will be able to change it by pressing Option – Change template and select your template from the list of all templates.

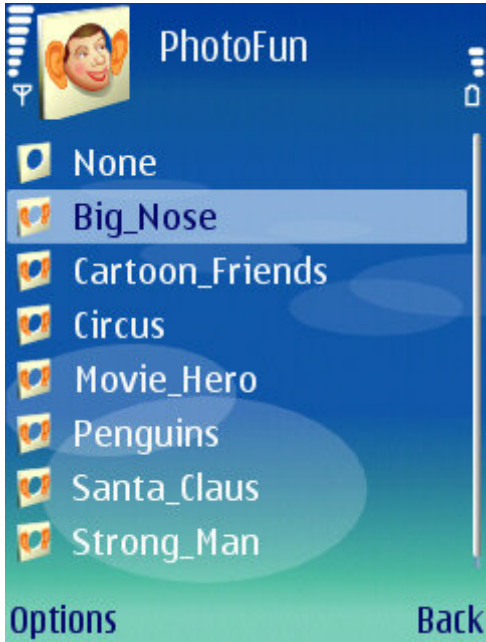

The templates are sorted alphabetically by their file name, so bear this in mind when giving the name to the template file.
